

AI Resume Screener

I build.

OPEN SOURCE / MIT

POWERED BY CLAUDE AI

Claude AI (Anthropic) · Vanilla JS · Zero Build Steps

OVERVIEW

AI Resume Screener is a fully browser-based recruitment intelligence tool powered by Claude AI (Anthropic). Recruiters define a job description, upload candidate resumes, tune five scoring-weight sliders, and receive an AI-ranked shortlist with per-dimension scores, strengths, gaps, and written feedback — all in a single browser tab with zero installation.

CORE FEATURES

1

Bulk Resume Upload

Drag-and-drop .txt files or paste resume text directly into the interface.

2

Custom Job Description

Set job title, department, experience level, and full JD to contextualise all scoring.

3

Adjustable Score Weights

Five range sliders let recruiters tune how much each dimension contributes to final rank.

4

AI-Powered Rankings

Claude reads every resume and returns an overall score, per-dimension bars, strengths & gaps.

5

Recruiter Q&A Chat

Ask follow-up questions — Claude answers with the full results JSON as context.

6

CSV Export

Download the complete ranked results table for further filtering or sharing.

LIVE APPLICATION — SETUP TAB

Setup Tab · Job Details, Description & Scoring Weight Sliders

ARCHITECTURE & CODE WALKTHROUGH

FILE	LINES	ROLE
index.html	~130	Single-page shell: tabs, forms, drop-zone, results & Q&A; panels.
style.css	~400	Dark-theme design system using CSS custom properties and responsive grid.
app.js	~290	All logic: state, file handling, Claude API calls, rendering & CSV export.
README.md	~90	Setup guide, feature list, project structure & API key instructions.

DATA FLOW — HOW IT WORKS

1

SETUP

Recruiter enters job title, experience level, full JD, and tunes 5 scoring-weight sliders (Skills 35%, Experience 25%, Culture 15%, Education 15%, Achievements 10%).

2

INGEST

Resumes added via file upload (.txt), drag-and-drop, or paste. Stored as a JS array of {name, text} objects in client memory.

3

ANALYSE

All resumes + JD + weights bundled into one Claude API prompt. Model returns a sorted JSON array with scores, strengths, gaps, verdict, and recommendation.

4

DISPLAY

Results render as expandable cards: overall score badge, per-dimension bars, strength/gap tags, AI feedback, and verdict.

5

Q&A

Ask AI tab sends follow-up questions with the full results JSON injected as context — enabling natural-language deep-dives on any candidate.

CLAUDE API INTEGRATION

Model	claude-sonnet-4-20250514
Endpoint	POST https://api.anthropic.com/v1/messages
Max tokens	1 000 per call
Calls / analysis	1 (all resumes batched into a single prompt)
Response format	JSON array – sorted by overallScore descending
Q&A; calls	1 per question; full results JSON injected as context
